09696872

May I have this rushed?

For 09696872, pls search:

SID 23 against the AA and NT data bases.

SID 24 against the AA and NT data bases.

SID 37 against the AA and NT data bases.

                                                                                                                                                                                  The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as CC heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat CC protein complexes to endoplasmic reticulum. This makes the secreted heat CC response to a target antigen. The inhibitor protein comprises several CC subunits where each subunit comprises an oligomerisation domain and has CC at its carboxy terminus a region which binds to a KDEL receptor. The CC target antigen may be associated with diseases including neoplasia such CC astromytoma, with defective tumour suppressor genes, oncogenes, CC infectious diseases, allergy or autoimmune diseases. The present CC sequence encodes KDEL receptor inhibitor comprising regions encoding a Ccleavable signal peptide; the oligomerisation domain of human cartilage coligomeric matrix protein (COMP) pentamerisation domain; a camel 1gG CC cloker domain and the carboxy-terminal sequence KDEL. The subsequence CC cDCC is an alteration of rat COMP which provides increased stability via

This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphona, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of human thrombospondin 4 (TSP4) trimerisation domain; a camel IGG linker domain alteration of rat cartilage oligomeric matrix protein which provides increased stability via disulphide bonds.

                                                                                                                                      secretion of proteins that are normally retained within the cell such as cheat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic retticulum. This makes the secreted heat shock protein more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has tearpet antigen may be associated with disease including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblascoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain, a canel 1gG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Chimeric -

This makes the secreted heat shock proteins more accessible to the immune system and improves immune cresponse to a target antigen. The inhibitor protein comprises several subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present collegomere encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain from rat cartilage collegomeric matrix protein (COMP); a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat COMP which provides increased stability via disulphide bonds. This

The patent discloses the use of KDEL receptor inhibitor to promote CC secretion of proteins that are normally retained within the cell such as CC heat shock proteins by inhibiting KDEL receptor-mediated return of CC protein complexes to endoplasmic reticulum. This makes the secreted heat CC shock proteins more accessible to the immune system and improves immune CC response to a target antigen. The inhibitor protein comprises several CC subunits where each subunit comprises an oligomerisation domain and has CC at its carboxy terminus a region which binds to a KDEL receptor. The CC target antigen may be associated with diseases including neoplasia such CC as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and CC astromytoma, with defective tumour suppressor genes, oncogenes, CC infectious diseases, allergy or autoimmune diseases. The present CC sequence encodes KDEL receptor inhibitor comprising regions encoding a CC cleavable signal peptide; a myc-tag; an N-glycosylation sequence; the CC oligomerisation domain of rat cartilage oligomeric matrix protein CC (COMP); a camel IgG linker domain and the carboxy-terminal sequence CC increased stability via disulphide bonds.

This makes the secreted heat Shock proteins more accessible to the immune system and improves immune CC response to a target antigen. The inhibitor protein comprises several CC subunits where each subunit comprises an oligomerisation domain and has CC at its carboxy terminus a region which binds to a KDEL receptor. The CC target antigen may be associated with diseases including neoplasia such CC as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and CC astromytoma, with defective tumour suppressor genes, oncogenes, CC infectious diseases, allergy or autoimmune diseases. The present CC sequence encodes KDEL receptor inhibitor comprising regions encoding a CC cleavable signal peptide; the oligomerisation domain from rat cartilage CC oligomeric matrix protein; a camel IgC linker domain and the carboxy creating sequence KDEL. This is introduced into host cells by suitable

The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as the shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sacroma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of Xenopus thrombospondin 4 (TSP4) trimerisation and including an additional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Chimeric - Mus sp.

Sequence 369
                           sub-sequence; a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides increased stability via disulphide bonds.

                                                                                                         shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of mouse thrombospondin 3 (TSP3) trimerisation domain including an additional sub-sequence; a camel IgG linker domain and the carboxy-terminal sequence MDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric

The patent discloses the use of KDEL receptor inhibitor to promote CC secretion of proteins that are normally retained within the cell such as CC heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic retriculum. This makes the secreted heat CC protein complexes to endoplasmic retriculum. This makes the secreted heat CC response to a target antigen. The inhibitor protein comprises several CC subunits where each subunit comprises an oligomerisation domain and has CC at its carboxy terminus a region which binds to a KDEL receptor. The CC target antigen may be associated with diseases including neoplasia such CC as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and CC carget antigen with defective tumour suppressor genes, oncogenes, CC infectious diseases, allergy or autoimmune diseases. The present CC sequence encodes KDEL receptor inhibitor comprising regions encoding a CC cleavable signal peptide; the oligomerisation domain of mouse CC thrombospondin 3 (TSPS) trimerisation domain; a camel IgG linker domain CC alteration of rat cartilage oligomeric matrix protein which provides increased erablite. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Chimeric

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of human phospholamban (PLB) pentamerisation domain; a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides concreased stability via disulphide bonds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat

                                                                                                                                                                                                                           New nucleic acids are described which encode a protein comprising the second and third type 1 repeats of human TSP (thrombospondin)-1, but not the TGF (transforming growth factor)-beta activation region of human TSP-1. The nucleic acid of TSP (thrombospondin)-1 containing the second and third type-1 repeats and the COMP (cartilage oligomeric matrix protein) assembly sequence (COMP/TSP-1) was produced by PCR (polymerase chain reaction). Expression of COMP/TSP-1 caused inhibition of the growth of tumours in mice models. Thus the nucleic acids and proteins may be useful for treating angiogenesis related diseases such as cancer (by reducing the rate of growth and size of tumours), arthritis, psoriasis, diabetic retinopathy, corneal graft rejection, and glacoma. They may also be
                                                                                                                                                  used for treating human immunodeficiency virus (HIV) infection. Anti-angiogenic therapy has little toxicity, does not require the therapeutic agent to enter tumour cells or cross the blood-brain barrier, controls tumour growth independently of growth of tumour cell heterogeneity, and does not induce drug resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acids encoding chimeric proteins such as cartilage oligomeric matrix protein (COMP)/thrombospondins (TSP)-1 and 2, useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               US-09-696-872-23 (1-109) x AAA47734 (1-755)
                      New nucleic acids are described which encode a protein comprising the second and third type 1 repeats of human TSP (thrombospondin)-1, but not the TGF (transforming growth factor)-beta activation region of human TSP-1. The nucleic acid of TSP (thrombospondin)-1 containing the second and third type-1 repeats and the COMP (cartilage oligomeric matrix protein) assembly sequence (COMP/TSP-1) was
                                                                                                                                                                                                                                                                         Nucleic acids encoding chimeric proteins such as cartilage oligomeric matrix protein (COMP)/thrombospondins (TSP)-1 and 2, useful for inhibiting angiogenesis and treating diseases such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    TSP-1; TSP-2; COMP; cartilage oligomeric matrix protein; thrombospondin; angiogenesis; tumour; treatment; cancer; arthritis; psoriasis; diabetic retinopathy; corneal graf
                                                                                                                                                                                                                     Claim 44; Fig 5a-b; 40pp; English.

caused inhibition of the growth of tumours in mice models. Thus the nucleic acids and proteins may be useful for treating angiogenesis related diseases such as cancer (by reducing the rate growth and size of tumours), arthritis, psoriasis, diabetic retinopathy, corneal graft rejection, and glaucoma. They may also used for treating human immunodeficiency virus (HIV) infection. Anti-angiogenic therapy has little toxicity, does not require the therapeutic agent to enter tumour cells or cross the blood-brain barrier, controls tumour growth independently of growth of tumour cell heterogeneity, and does not induce drug resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 925 BP; 156 A; 310 C; 312 G; 147 T; 0 other;

The methods are useful in diagnosing, treating, detecting the progression, and in monitoring treatment of breast cancer in patients. The methods are also useful as a screening tool for agents that modulate the onset or progression of breast cancer. The breast cancer genes may be used as diagnostic markers for the prediction or identification of the malignant state of breast tissue, for confirming the type and progression of cancer, and for drug screening and assays. The present sequence is a coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosing breast cancer in a patient comprises detecting the level of gene expression in cell or tissue samples, where a differential gene expression is indicative of breast cancer -
                                                                                                                                         Breast cancer-associated gene sequence
                                                                                                                                                                              14-NOV-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The method of the invention involves contacting a biological sample from the patient with a nucleotide that thybridises to one of the 69 breast cancer-associated gene sequences shown in the specification. The method of the invention is useful in the cdiagnosis of breast cancer, and for detecting genes that are up or down-regulated in breast cancer cells. Genes identified by the cancer cancer cells. Genes dentified by the cancer cancer (e.g. hormones or antibodies). Identification of genes that are cover or under expressed in breast cancer can additionally provide higher cover or under expressed in breast cancer can additionally provide higher cover or under expressed in breast cancer can additionally provide higher cover or the capture of the cancer can additionally brovide higher cover or the capture of the capture of the sequences ABT07761 are represent the 69 breast cancer-associated gene sequences of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method (M1) for screening for an CC anti-neoplastic agent. The method involves exposing cells to a chemical CC agent to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) CC comprises a sequence (S) selected from 8447 sequences (given in ABL61664 CC to ABL70110), or is at least 95% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic CC activity and can be used in gene therapy. M1 can be used for screening CC is the data collected with respect to the anti-neoplastic agent as a CC result of M1, and the data is sufficient to convey the chemical CC treatment of cancer such as colon, breast, stome, thyroid, CC ossophageal, ovarian, kidney, prostate or pancreatic cancer, cafenoarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine CC carcinoma, papillary carcinoma and Wilm's tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 2439 BP; 503 A; 758 C; 809 G; 369 T; 0 other;
